ABSTRACT

Abstract

Verbal aggressiveness is a form of behaviour that aims to hurt other individuals through words or gestures. This negative behaviour indicates that individuals are emotionally immature. Conformity can affect the onset of verbal aggressiveness behaviour because individuals tend to imitate the negative actions of their group members. Play intensity can also affect the onset of verbal aggressiveness behaviour because the higher the level of play intensity experienced by individuals, the more frequent the obstacles experienced by these individuals. This study aims to determine the relationship between conformity and play intensity with verbal aggressiveness. This research is a correlational quantitative research. The method of collecting respondent data in this study is a non-probability sampling method using purposive sampling. The number of respondents in this study was 223 people. The results of this study were tested using Spearman Rho data analysis. The correlation test results show that there is a very significant positive relationship between conformity and verbal aggressiveness, in other words, the higher the conformity, the higher the verbal aggressiveness. The results of the correlation test between the play intensity variable and the verbal aggressiveness variable show that there is a very significant positive relationship between the play intensity variable and verbal aggressiveness so that the higher the play intensity, the higher the verbal aggressiveness.

Keywords: Conformity, Play Intensity, Verbal Aggressiveness
