

CHAPTER V

CONCLUSION AND SUGGESTION

After analyzing the common abbreviation found in twitter the writer presents the general conclusion from this research and makes some suggestions for this research. The writer makes her mind up for taking three general conclusions of the study on the morphological process of common abbreviations found in twitter.

First, the type of abbreviation is divided into four categories. They are initial letters, Non-initial letters, Pseudo Initialism and Acronym. While Non-initial letters are divided into two categories, that are contraction and shortening.

Second, the formation process. The initial letters are formed by taking the initial letter of each words, contractions are formed by taking some letters in a word, Shortening is formed by taking some first letters in a word, pseudo initialism is formed by pronounced the letters as single word, while Accronym is the same as initial letters which is taking the initial letter but in acronym they are pronounced as single words.

Third the *tweeps'* reasons to form abbreviations seem to be, among others, to fit the limited space available in the twitter media, make it easy to be formed, to make it easy to pronounce, and easy to memorize. The most used of abbreviations is initial letters, because initial letters is actually taking the least space in reducing the long sentences. Meanwhile, the least used is contraction, because actually using contraction will make the words hard to understand. This study hopefully gives better knowledge on how to study the formation processes and categories of abbreviations.
