## Abstract

Decision support system is a field of computer science that has developed rapidly and is widely used not only in the field of computer science but is also widely used by companies, agencies and the health sector as a decision support factor in providing solutions to problems that are not valid or unclear. that cannot be measured with certainty, in this case it is discussing the problem of nutritional status.

This system is to find out the stunting status of toddlers based on a website that can be accessed by the wider community via the internet. With the application of the Naïve Bayes method in making the final decision on stunting status in the under-fives studied. Can make it easier for the community to check their toddler's development at any time because they only need to access the toddler stunting status application website on the internet.

## Abstrak

Sistem pendukung keputusan merupakan bidang ilmu komputer yang telah berkembang pesat dan banyak digunakan tidak hanya dalam bidang ilmu komputer tetapi juga banyak digunakan oleh perusahaan-perusahaan, instansi- instansi dan bidang kesehatan sebagai faktor pendukung keputusan dalam memberikan solusi atas masalah yang tidak valid atau samar-samar yang tidak bisa diukur dengan pasti, dalam hal ini adalah membahas permasalahan status gizi.

Sistem ini untuk mengetahui status stunting pada balita berbasis website yang dapat di akses masyarakat luas melalui internet. Dengan penerapan Metode Naïve Bayes dalam pembuatan keputusan akhir tentang status stunting pada balita yang diteliti. Dapat mempermudah masyarakat dalam pengecekan perkembangan balita mereka sewaktu-waktu karena hanya butuh mengakses website aplikasi status stunting balita di internet.

## 1. PENDAHULUAN

Perkembangan teknologi informasi sekarang ini telah mampu membantu manusia untuk mengambil keputusan, sehingga dapat

mengurangi resiko kesalahan yang dapat terjadi karena beberapa kekurangan yang dimiliki oleh manusia. Sistem Ini dikenal dengan sistem pendukung keputusan (Decision Support System). Stunting adalah

7  
suatu masalah gizi kronis yang terjadi pada balita ditandai dengan ukuran tinggi badan yang lebih pendek dibandingkan dengan balita seusianya. Dampak dari stunting tidak hanya pada kesehatan tetapi juga dapat mempengaruhi tingkat kecerdasan balita. Penelitian ini membuat sebuah sistem pendukung keputusan sebagai penentu status stunting balita dengan menggunakan naïve bayes. Dimana dengan metode naïve bayes ini user dapat melihat secara langsung status stunting balita.

Permasalahan yang diangkat dalam penelitian ini merupakan bagaimana cara mendeteksi dini pada balita yang mengalami gejala stunting atau normal dengan mudah dan akurat, kemudian merancang sebuah program sistem pendukung keputusan yang mampu mendeteksi status stunting pada balita dengan metode naïve bayes agar mudah diakses oleh masyarakat dalam mengimplementasikan sistem pendukung keputusan.

Permasalahan ini dibatasi dengan kondisi fisik balita mulai usia 1 bulan sampai 5 tahun yang diukur data variabel yaitu usia, tinggi badan, berat badan, lingkaran lengan atas, lingkaran lengan bawah, lingkaran kepala, lingkaran dada dan lingkaran perut balita.

Tujuan penelitian ini membuat program aplikasi untuk mengetahui status stunting pada balita berbasis website dan menguji penerapan metode naïve bayes dalam pembuatan keputusan akhir.

Penelitian ini bermanfaat untuk masyarakat dalam pengukuran perkembangan balita mereka dan membantu para kader posyandu dalam mendeteksi dini resiko stunting pada balita yang mereka periksa saat kegiatan posyandu.

## 2. METODOLOGI PENELITIAN

Metodologi penelitian yang dilakukan dalam penyusunan terdiri dari :

### A. Identifikasi Masalah

Identifikasi masalah meliputi pengamatan dari kegiatan Posyandu yang berisi pengukuran fisik balita dan pencatatan di buku Kesehatan Ibu dan Anak (KIA).

### B. Perumusan Masalah

Merumuskan tentang masalah stunting yang baru dicanangkan pemerintah belum maksimal dapat diidentifikasi di masyarakat karena terbatasnya waktu kegiatan Posyandu dan minimnya pengetahuan masyarakat tentang bahaya stunting pada balita.

### C. Perancangan Aplikasi

Perancangan aplikasi dilakukan dengan merancang berdasarkan hasil perumusan masalah yang telah dilakukan. Perancangan dilakukan untuk mendapatkan rancangan dan model, user interface.

### D. Pembuatan Aplikasi

Pembuatan aplikasi di XAMPP dan Notepad++ dilakukan dengan mengimplementasikan hasil rancangan ke dalam program. Hasil tahap ini adalah kode yang siap dieksekusi.

### E. Pengujian Aplikasi

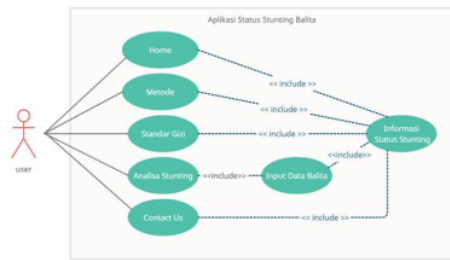

Pengujian aplikasi dengan proses pengujian dan analisis kevalidan dari perangkat lunak yang dihasilkan untuk menghindari kesalahan-kesalahan yang diakibatkan oleh kesalahan procedure dan bukan karena human error, serta untuk mengetahui tingkat kepuasan pengguna akan sistem ini.

### F. Penyusunan Laporan

Langkah terakhir adalah melakukan penulisan hasil akhir dari penelitian yang meliputi teori dasar, proses perancangan, pembuatan, dan hasil pengujian.

#### 2.1. Use Case Diagram Aplikasi

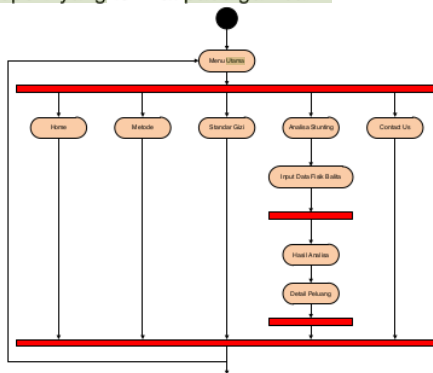

Use Case diagram pada perancangan aplikasi ini dibuat secara keseluruhan, proses penggambaran use case ini disesuaikan dengan keperluan aplikasi, perancangan yang ditunjukkan pada gambar 1.

Gambar 1. Use case diagram aplikasi

### 2.2. Diagram Activity

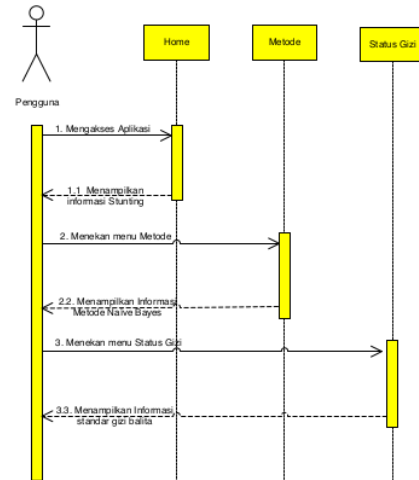

Diagram Activity merupakan proses berjalannya aplikasi keseluruhan dengan menunjukkan alur secara urut mulai dari awal aplikasi hingga isi dari aplikasi tersebut sehingga dengan adanya diagram activity ini kita juga dapat melihat dengan mudah isi dari fitur kegiatan yang ada pada aplikasi ini seperti yang terlihat pada gambar 2.

Gambar 2. Diagram Activity

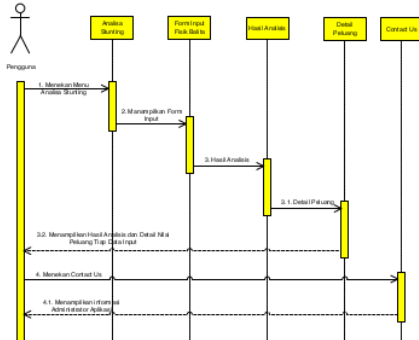

### 2.3. Diagram Science

Dari gambar 3. di bawah ini dapat dilihat bahwa user dapat mengatur apa yang diinginkan dengan memilih menu dari awal mengakses aplikasi di gambarkan bahwa urutan kegiatan aplikasi di mulai dari sisi kiri ke sisi kanan sesuai panah yang dituju sesuai waktu terjadinya asean yang terurut, dari tampilan gambar 3. user dapat mengetahui informasi mengenai stunting, metode analisis dan nilai standar gizi yang ditampilkan pada menu masing-masing.

Gambar 3. Diagram Sequence Menu Home, Metode dan Status Gizi

Sedangkan menu analisa stunting, pengguna memilih menu dan memasukkan data fisik balita yang selanjutnya pengguna akan ditampilkan hasil penilaian status resiko atau tidak berisiko stunting pada seorang balita. Sedangkan menu contact us menggunakan ditampilkan informasi administrator aplikasi sebagaimana gambar 4.

### 2.4. Struktur Menu Aplikasi

Dalam mempermudah penggunaan aplikasi, peneliti merancang diagram alur struktur menu aplikasi sehingga penggunaan aplikasi dapat dilakukan secara terstruktur dan mudah di gunakan. Adapun diagram menu dapat di lihat pada Gambar 5.

Gambar 5. Struktur Menu Aplikasi

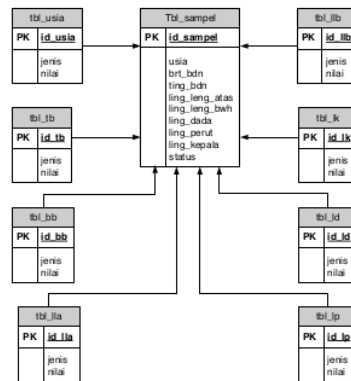

Berikut penjelasan dari setiap nomor dari proses, inisiasi, dan output pada struktur menu aplikasi Augmented Reality.

1. Gambar 5. merupakan tampilan menu dari aplikasi. Dari halaman utama atau menu Home terdapat informasi mengenai pentingnya pencegahan stunting pada balita yang dicanangkan oleh pemerintah.
2. Menu Metode merupakan menu yang menampilkan halaman informasi metode naive bayes yang merupakan metode utama perhitungan analisis risiko stunting pada balita.
3. Menu Standar Gizi merupakan menu yang menampilkan halaman informasi nilai standar gizi balita yang dikeluarkan oleh WHO dan dijadikan acuan penilaian nilai standar gizi balita di dunia.
4. Menu Analisa Stunting merupakan menu yang berisi halaman form input data fisik balita yang akan diperiksa apakah masuk kategori risiko stunting atau tidak. Hasil dari input data fisik berupa halaman hasil analisa yang berisi informasi balita yang diperiksa termasuk balita resiko stunting atau normal.
5. Menu Contact Us berisi halaman informasi kontak personal administrator berupa nomor whatsapp, alamat email dan akun media sosial.

### 2.5. Class Diagram

Pada Class Diagram pada sistem penentu risiko stunting pada balita memiliki model sebagaimana gambar 6. Pada Class Diagram tersebut dapat dijelaskan bahwa susunan tabel dalam database memiliki hubungan relasi one to many yang memiliki fungsi nama tabel data mulai `tbl_usia`, `tbl_tb`, `tbl_bb`, `tbl_lla`, `tbl_llb`, `tbl_lk`, `tbl_ld`, `tbl_lp`

menjadi tolak ukur nilai yang berada di dalam tabel `tbl_sampel` yang berisi data balita.

5. Proses Perhitungan Probabilitas

Proses penghitungan dalam sistem ini menggunakan metode Naïve Bayes yang meliputi beberapa tahap seperti pengklasifikasian hasil diagnosis, mencari probabilitas tiap atribut, serta mencari nilai terbesar untuk menghasilkan keputusan selanjutnya diagnosis.

Untuk menghitung probabilitas bersyarat untuk menghasilkan keputusan dapat dimisalkan dengan menggunakan tabel 15.

Karena  $P(XIS1) < P(XIS2)$ , maka status dari data tes adalah **BERISIKO STUNTING**.

### 3.2. Implementasi Interface

Pengujian aplikasi dilakukan secara langsung dengan membuild aplikasi ke website untuk mengecek apakah semua modul bekerja dengan baik.

#### 1. Tampilan halaman analisa stunting

Pada halaman analisa stunting pengguna diharuskan mengisi data balita berdasar parameter yang telah ditentukan oleh sistem. sebagaimana gambar 7.

Gambar 7. Halaman Analisa Stunting

#### 2. Hasil Analisis

Halaman ini berisi hasil analisis status risiko stunting pada balita menggunakan metode naïve bayes berdasarkan data fisik balita yang telah dimasukkan pada halaman form isian data. Pada halaman ini ditampilkan rekap isian data balita beserta hasil analisis sistem apakah data balita yang telah dimasukkan termasuk dalam kategori balita tidak berisiko stunting atau berisiko stunting. Sebagaimana gambar 8.

Gambar 8. Hasil Analisis Sistem

## 4. HASIL PENGUJIAN

Hasil pengujian dilakukan dengan pengujian akurasi metode naïve bayes yang telah dibuat. Pada pengujian akurasi metode, sistem dikatakan memiliki kinerja tinggi apabila output status stunting yang dihasilkan oleh sistem memiliki nilai yang sama dengan status stunting pada data training (data sampel). Berikut hasil pengujian sebagaimana tabel 17 dan tabel 18.

Ket :  Baris nilai error program

Dari tabel diatas dapat diketahui bahwa validasi nilai output program penentu status stunting balita dari 150 data sampel sebanyak 118 data yang bernilai Valid dan 32 data bernilai False atau Error yang ditandai dengan warna merah muda. Berdasarkan pengujian tersebut, maka nilai prosentasi validasi sistem penentu resiko stunting balita dapat jelaskan sebagai berikut.

Banyak Data = 150

Nilai Valid = 118

Nilai Error = 32

$$\text{Prosentase Valid} = \frac{\text{Nilai Valid}}{\text{Banyak Data}} \times 100\%$$

$$\text{Prosentase Valid} = \frac{118}{150} \times 100\%$$

Prosentase Valid = 78,67 %

## 5. PENUTUP

### 5.1. Kesimpulan

Dari hasil penelitian, dapat disimpulkan bahwa :

1. Sistem yang dibuat dapat digunakan sebagai alat untuk menentukan status stunting pada balita.
2. Metode naïve bayes dapat digunakan untuk menentukan status stunting pada balita berdasar kondisi fisik balita yang dapat diukur.

### 5.2. Saran

Untuk pengembangan lebih lanjut diharapkan dapat memperbaiki kinerja sistem agar lebih baik, diantaranya :

1. Penambahan parameter selain fisik untuk memperjelas keadaan balita apakah berpengaruh terhadap resiko stunting.
2. Penambahan data sampel agar hasil analisis sistem lebih akurat.
